

BLUESQUARE

laso

From data collection to geospatial data management in public health and more!

FOSS4G - 17/11/2022

Bluesquare - Who are we?

- Belgium global data company focused on digital health in low- and middle-income countries
- Founded in 2012
- Active in more than 30 countries, donors, international partners and governments
- Support governments and their partners to digitize public health services and make performance data available to decision-makers
- Domains: Health Financing, Geospatial Information, M&E, logistics management, data sciences for health, infrastructure hosting
- Iaso is one of our open-source tools developed in order to enhance offline data collection with a spatial focus and help coordinate multiple sources of data.

IASO

YOUR ALLY FOR DATA
COLLECTION CAMPAIGNS

IASO is a data collection platform with advanced geospatial features developed by Bluesquare to support the **continuous management of geographical information, microplanning of data collection activities and data collection itself.**

Bi-directional
integration
with DHIS2

Already more than
547 374
forms collected

Open-source

Used in more than
10
large-scale
projects

Online &
Offline
features

Branded Mobile App for
Data collection

Additional data sources

IASO

Data collection and
management platform

dhis2

Main features

- **Managing reference GIS data** (territories / hierarchies / locations)
- **Microplanning data collection activities** based on the GIS data
- **Collecting data** (online/offline) and **monitoring** data collection
- **Open Source** (Python/Django/Postgres+PostGIS)/React based

Affection pour le planning: Planning Juillet

CARTE LISTE

Equipe: Equipe pays Types d'unités d'org. de base: District APPLIQUER

Selection	Nom	Couleur	Nombre d'assignments
<input checked="" type="radio"/>	Est	Orange	3
<input type="radio"/>	Nord	Jaune	3
<input type="radio"/>	Ouest	Bleu	4
<input type="radio"/>	Sud	Rouge	3

Mode sélection de parent: Types d'unités d'org. parent

Affection pour le planning: Planning Juillet

CARTE LISTE

Selection	Nom	Couleur	Nombre d'assignments
<input checked="" type="radio"/>	cperardplanning	Rouge	4
<input type="radio"/>	mlienerplanning	Jaune	10
<input type="radio"/>	oliverplanning	Vert	13
<input type="radio"/>	madewulfplanning (Martin De Wulf)	Bleu	9
<input type="radio"/>	benjaplanning	Violet	23
<input type="radio"/>	laureplanning	Orange	14

Mode sélection de parent: Types d'unités d'org. parent

Boring technologies for innovative platform

ODK for the form engine

Jetpack + Kotlin for the mobile app

Android Jetpack

PostGIS for the DB

(Geo)Django

django

Frontend:

Leaflet/React/Material UI

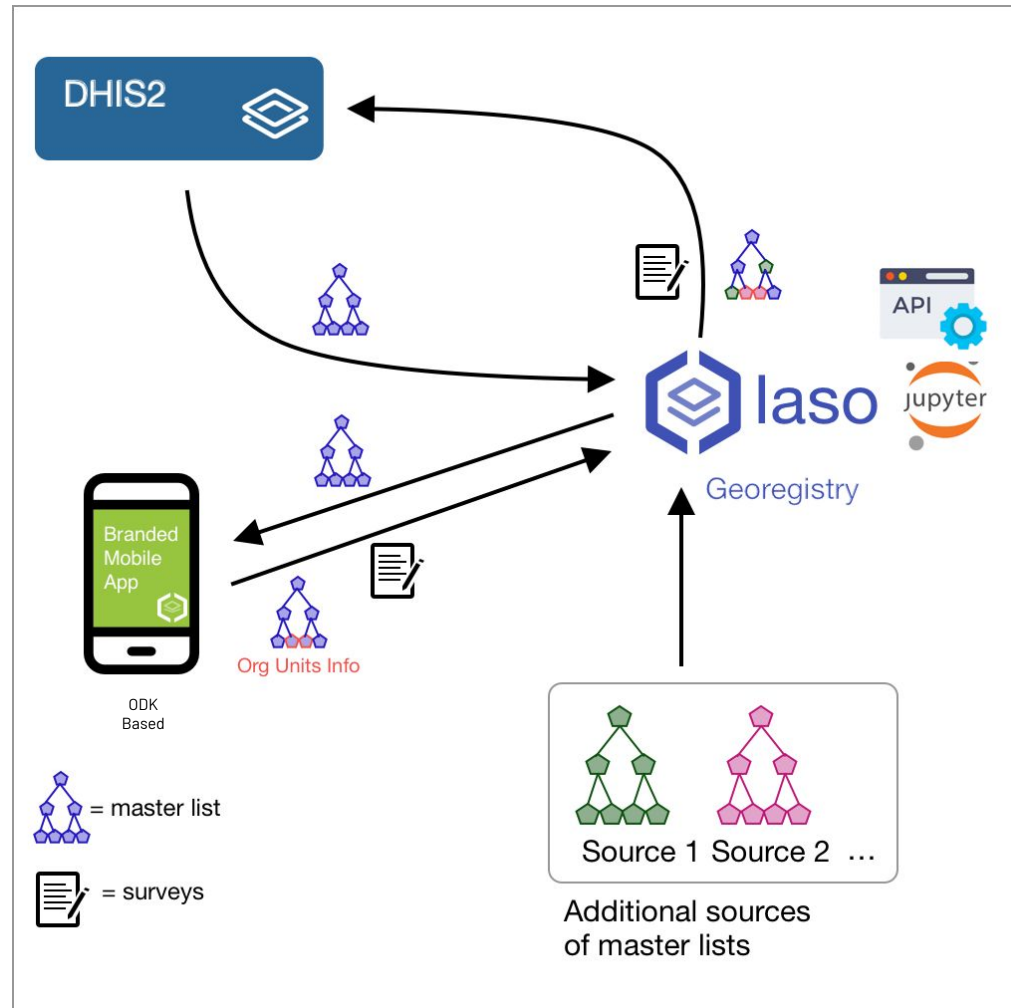

React

It is not only about laso

- laso integrated in multiples workflow by being able to share data (forms, hierarchies) with other infrastructure
- In Performance Based Financing programs, data are collected through laso shared with the DHIS2 platform where the invoicing is generated and shared back with the health centers and stakeholders.
- In Polio distribution vaccines campaign, laso is part of tracking of delivery infrastructure

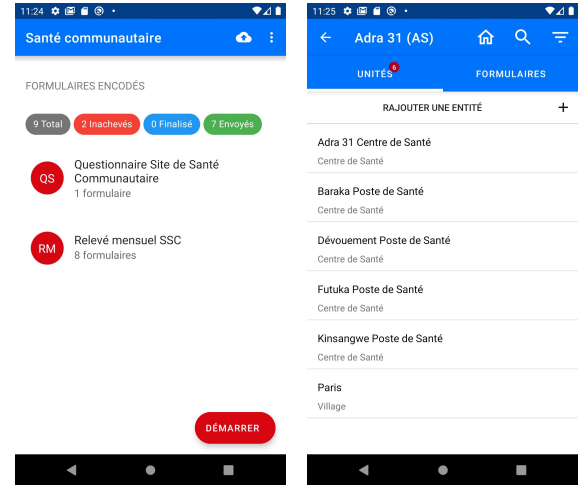

How is laso currently used?

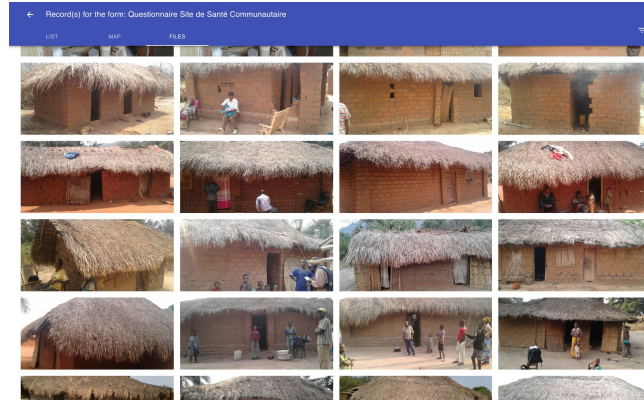

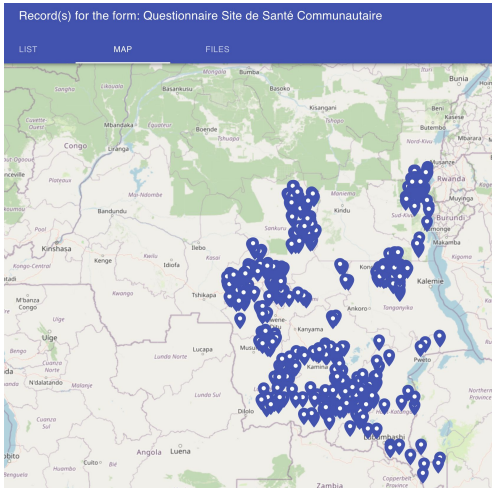

- Monitoring of 48 polio campaigns where each campaign target 2.5M children
- To identify and geolocate the Integrated community care management sites (iCCMs) in DRC through USAID Integrated Health Program
- To identify and geolocate 109K schools on DRC's schools map (funded by Cordaid)
- To collect health data periodically for financing purpose in DRC, Ivory Coast, Burundi, Niger, Haïti and Cameroon.
- For the census of over 30,000 health facilities and villages in Cameroon (Cameroon's Expanded Program for Immunization)

Mobile application : data collection

- Used to support surveys as routine data collection processes
- Customized to the branding of the project
- Forms based on ODK (XLSForms)
- Offline and online data collection
- GPS coordinate acquisition can be:
 - In the background during form filling process
 - Actively taken during the form filling process
 - Pointed on a map in the form
- User activated tracking GPS to cover an area by taking location sampling points at regular time intervals
- Validation phase before enriching the general georegistry

Example data collection: Community Health Sites

Georegistry: Multiples hierarchies/sources

- Dataset
 - Grouping concept for one source
 - Versioned fully
 - Can be externally imported (DHIS2/Geopackage)
- Full data/metadata history kept for every data element; change traceability and possible rollbacks
- Support any PostGIS geometry during import/export
- Geopackage follows a specific format to leverage laso grouping features as Organization Units Type

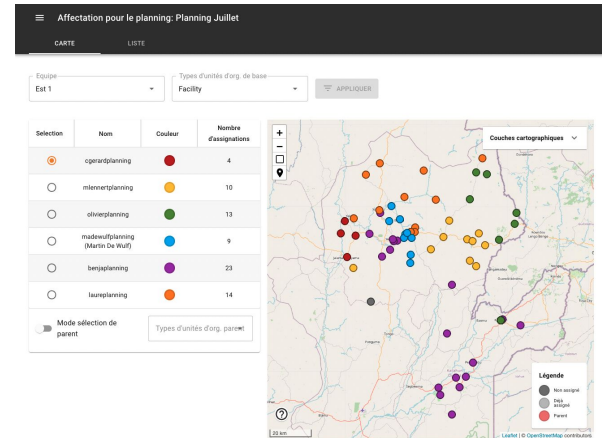

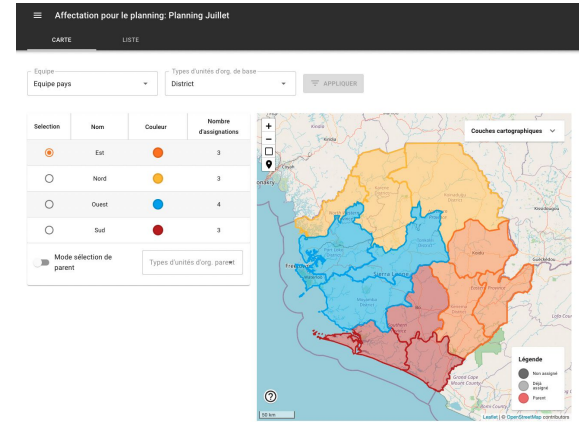

Georegistry: Links between sources and API

- Basic matching algorithms directly available
- Possible to create a "link" between two elements (= being the same)
 - Across versions of the same dataset
 - Across datasets
- Comparison and merging of multiple data sources
- Data model exposed through the API allow to use more sophisticated algorithms to evaluate the data element

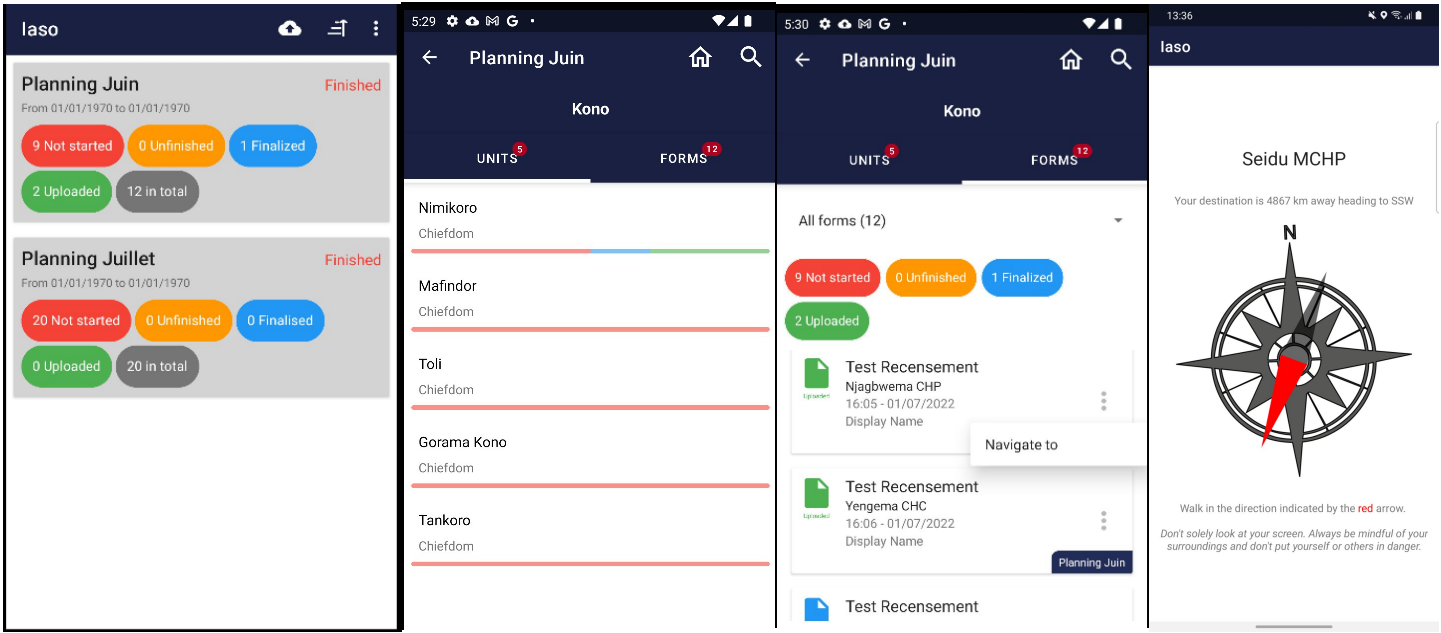

Microplanning (team/individual assignments and monitoring)

- Allocation of places to visits and forms to fill to users
- Support in the mobile application: each user receives an easy to navigate list of tasks
- Monitoring of execution of the planning by the team/user/region/supervisor

Microplanning (team/individual assignments and monitoring)

Additional Features

1. DHIS2 Exports
2. Multi search
3. Programmable through a Rest API (Jupyter)
4. Designed to allow adding custom algorithms run as long running tasks on workers
5. Exports and imports to CSV/Geopackage
6. Multi tenant
7. Lots of feature flags for the mobile apps (GPS on, authentication, auto upload)
8. Open source (MIT License): <https://github.com/BLSO/iaso>
9. Hostable locally
